

Interoperability in Programming Languages

Todd Malone

Division of Science and Mathematics
University of Minnesota, Morris
Morris, Minnesota, USA

28 April 2014
Senior Seminar

What is Interop?

- Interoperability: The ability for a system to use parts from another system.
- Often shortened to interop.
- In programming languages: The ability of a language to call on code from another language.

Why is Interop Important?

Developer time and effort

- Existing and working code is easier to use as-is.
- Third-party systems: source code is unavailable
- Legacy systems: extensive or little-understood code base.

Language Strength:

- Explicit memory access (C)
- Parallel or distributed systems (Clojure, Erlang)
- Statistics (R)

Outline

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties
- 3 Tools used in achieving interoperability
- 4 Conclusions

Outline

- 1 Common difficulties in interop
 - Type systems
 - Data structures
 - Data processing
- 2 Concepts in handling difficulties
- 3 Tools used in achieving interoperability
- 4 Conclusions

Differences in type systems

- Languages represent data in different ways
- Statically-typed languages assign types as soon as data is collected.
- Dynamically-typed languages only deal with types when evaluating data.
-

```
Class Person
  string name = "Cliff"
  date dateOfBirth = 4/16/1978
  int height = 74
  double weight = 212
end
```

```
Class Person
  var name = "Cliff"
  var dateOfBirth = 4/16/1978
  var height = 74
  var weight = 212
end
```

Mismatched structures

- Untyped lists can contain different types,
- Strongly typed lists can only contain the type given by the list.
- A data structure in one language may be absent in another
- Maps are common data structures, but absent in C.

```
[23, v, "hello", True]
```

An untyped list

```
{:name "Cliff", :age 32}
```

A map

Handling data

- Languages act on data in different ways.
- Handling NULL or NIL objects.
- Decimal precision: Java returns 12.999999, .NET returns 13

Outline

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties**
 - Metadata
 - Standards
- 3 Tools used in achieving interoperability
- 4 Conclusions

Metadata and type conversion

Metadata: Data about data

or: Information beyond what the data itself can convey

```
(def mylist [1, 2, 3, 4])  
(with-meta mylist {:length 4, :type Integer}))
```

In Clojure:

- lists are untyped; can contain entries of different types.
- metadata, added as above, is all user-controlled.

Why Metadata?

- Decontextualized data can carry context with it
- Data transfer between languages with different type strictness.

```
Class Person
  var name = ["Cliff", "string"]
  var dateOfBirth = [4/16/1978, "date"]
  var height = [74, "int"]
  var weight = [212, "double"]
end
```

The importance of Standards

Standards are meant to ensure:

- Agreement on what metadata is being used, and how
- Unsurprising data processing
- Avoidance of data loss due to the above.

Outline

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties
- 3 Tools used in achieving interoperability**
 - Virtual Machines
 - Markup Languages
- 4 Conclusions

Virtual Machines

- Virtual Machines (VMs) are a runtime environment for a program
- High-level languages compile to an intermediate language
- Intermediate language: Java bytecode or Common Intermediate Language

Wikipedia

https://en.wikipedia.org/wiki/Common_Intermediate_Language_Runtime

High-level vs Bytecode

```
public class Fib{  
    public int fibonacci(int n) {  
        if(n == 0){  
            return 0;  
        }else if(n == 1){  
            return 1;  
        }else{  
            return fibonacci(n - 1) + fibonacci(n - 2);  
        }  
    }  
}
```

```
public class Fib {  
    public Fib();  
        Code:  
        0: aload_0  
        1: invokespecial #1  
        4: return  
  
    public int fibonacci(int)  
        Code:  
        0: iload_1  
        1: ifne          6  
        4: iconst_0  
        5: ireturn  
        6: iload_1  
        7: iconst_1  
        8: if_icmpne     13  
       11: iconst_1  
       12: ireturn  
       13: aload_0  
       14: iload_1  
       15: iconst_1  
       16: isub  
       17: invokevirtual #2  
       20: aload_0  
       21: iload_1  
       22: iconst_2  
       23: isub  
       24: invokevirtual #2
```

Markup Languages

- Markup languages are a way of modeling data.
- XML and JSON can model data like objects.
- Markup languages are independent of programming languages.

```
<Person>
  <name> Cliff </name>
  <birthdate> 4/16/1978 </birthdate>
  <height> 74 </height>
  <weight> 212 </weight>
</Person>
```

```
{
  "name": "Cliff",
  "birthdate": "4/16/1978",
  "height": "74",
  "weight": "212";
}
```

Outline

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties
- 3 Tools used in achieving interoperability
- 4 Conclusions**
