## Interoperability in Programming Languages

#### Todd Malone

Division of Science and Mathematics University of Minnesota, Morris Morris, Minnesota, USA

> 28 April 2014 Senior Seminar

# What is Interop?

- Interoperability or Interop
- The ability for a system to use parts from another system
- In programming languages: The ability of a language to call on code from another language

Bluedrakon http://tr.im/pWUi

# Why is Interop Important?

#### Developer time and effort

- Existing and working code is easier to use as-is.
- Third-party systems: source code is unavailable
- Legacy systems: extensive or little-understood code base.

### Language Purpose:

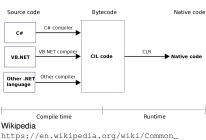

- Low-level memory access(C)
- Parallel or distributed systems (Erlang, Clojure)
- Statistics (R)

- 1 Tools used in achieving interoperability
- 2 Common difficulties in interop
- 3 Concepts in overcoming difficulties
- 4 Conclusions

- 1 Tools used in achieving interoperability
  - Virtual Machines
  - Markup Languages
- 2 Common difficulties in interop
- 3 Concepts in overcoming difficulties
- 4 Conclusions

### Virtual Machines

- Virtual Machines (VMs) are a runtime environment for a program
- High-level languages compile to an intermediate language
- Intermediate language: Java bytecode or Common Intermediate Language

https://en.wikipedia.org/wiki/Common\_ Language\_Runtime

## High-level vs Bytecode

```
public class Fib{
                                                  public class Fib {
                                                    public Fib();
public int fibonacci(int n) {
                                                      Code:
    if(n == 0){
                                                         0: aload 0
        return 0;
                                                         1: invokespecial #1
                                                                                               // Method java/lang/Object."<init>":()V
                                                         4: return
    else if(n == 1){
     return 1:
    }else{
                                                    public int fibonacci(int);
     return fibonacci(n - 1) + fibonacci(n - 2);
                                                      Code:
                                                         0: iload 1
                                                         1: ifne
                                                         4: iconst 0
                                                         5: ireturn
                                                         6: iload 1
                                                         8: if icmpne
                                                        11: iconst 1
                                                        12: ireturn
                                                        13: aload 0
                                                        14: iload 1
                                                        15: iconst 1
                                                        16: isub
                                                                                               // Method fibonacci:(I)I
                                                        17: invokevirtual #2
                                                        20: aload 0
                                                        21: iload 1
```

# Markup Languages

- Markup languages are a way of modeling data.
- XML and JSON can model data like objects.
- Markup languages are independent of programming languages.

- 1 Tools used in achieving interoperability
- 2 Common difficulties in interop
  - Type systems
  - Data structures
  - Data processing
- 3 Concepts in overcoming difficulties
- 4 Conclusions

# Differences in type systems

- Languages represent data in different ways

### Mismatched structures

- Untyped lists can contain different types
- Strongly typed lists can only contain the type given by the list
- A language might not have an analogous structure

# Handling data

Languages act on data in different ways

- 1 Tools used in achieving interoperability
- 2 Common difficulties in interop
- 3 Concepts in overcoming difficulties
  - Metadata
  - Standards
- 4 Conclusions

## Metadata and type conversion

### Metadata: Data about data

```
(def mylist [1, 2, 3, 4])
(with-meta mylist {:length 4, :type Integer})
```

### In Clojure:

- lists are untyped; can contain entries of different types.
- metadata, added as above, is all user-controlled.

# Why Metadata?

- Decontextualized data can carry context with it
- Data transfer between languages with different type strictness.

# The importance of Standards

- 4 Conclusions

## Conclusions

## Thank you for listening!
