Interoperability in Programming Languages

Todd Malone

Division of Science and Mathematics University of Minnesota, Morris Morris, Minnesota, USA

> 28 April 2014 Senior Seminar

What is interop?

- Interoperability: The ability for a system to use parts from another system.
- Often shortened to interop.
- In programming languages: The ability of a language to call on code from another language.

Why is interop important?

Developer time and effort

- Existing and working code is easier to use as-is.
- Third-party systems: source code is unavailable
- Legacy systems: extensive or little-understood code base.

Language Strength:

- Explicit memory access (C)
- Parallel or distributed systems (Clojure, Erlang)
- Statistics (R)

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties
- Tools used in achieving interoperability
- 4 Conclusions

- 1 Common difficulties in interop
 - Type systems
 - Data structures
 - Data processing
- 2 Concepts in handling difficulties
- 3 Tools used in achieving interoperability
- 4 Conclusions

- Languages represent data in different ways
- Statically-typed languages assign types as soon as data is collected.
- Dynamically-typed languages only deal with types when evaluating data.

```
int height = 74
  double weight = 212
end

Class Person
  var name = "Cliff"
  var dateOfBirth = 4/16/1978
  var height = 74
  var weight = 212
end
```

string name = "Cliff" date dateOfBirth = 4/16/1978

Class Person

Mismatched structures

- Untyped lists can contain different types,
- Strongly typed lists can only contain the type given by the list.

```
[23, v, "hello", True]
An untyped list
```

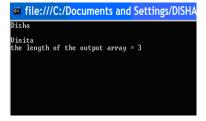

- A data structure in one language may be absent in another
- Maps are common data structures, but absent in C.

```
{:name "Cliff", :age 32}
A map
```

Handling data

- Languages act on data in different ways.
- Handling NULL or NIL objects.
- Decimal precision: Java returns 12.999999, .NET returns 13

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties
 - Metadata
 - Standards
- 3 Tools used in achieving interoperability
- 4 Conclusions

Metadata and type conversion

```
Metadata: Data about data or: Information beyond what the data itself can convey (def mylist [1, 2, 3, 4]) (with-meta mylist {:length 4, :type Integer})
```

In Clojure:

- lists are untyped; can contain entries of different types.
- metadata, added as above, is all user-controlled.

Why metadata?

- Decontextualized data can carry context with it
- Data transfer between languages with different type strictness.

The importance of standards

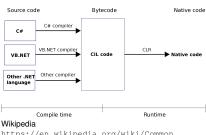

Standards are meant to ensure:

- Agreement on what metadata is being used, and how.
- Unsurprising data processing

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties
- 3 Tools used in achieving interoperability
 - Virtual Machines
 - Markup Languages
- 4 Conclusions

Virtual machines

- Virtual Machines (VMs) are a runtime environment for a program
- High-level languages compile to an intermediate language
- Intermediate language: Java bytecode or Common Intermediate Language

https://en.wikipedia.org/wiki/Common_ Language_Runtime

High-level vs Bytecode

```
public class Fib{
                                                   public class Fib {
                                                      public Fib();
public int fibonacci(int n) {
                                                        Code:
    if(n == 0){
                                                           0: aload 0
        return 0;
                                                           1: invokespecial #1
    else if(n == 1){
                                                           4: return
      return 1;
    }else{
                                                      public int fibonacci(int)
      return fibonacci(n - 1) + fibonacci(n - 2);
                                                        Code:
                                                           0: iload 1
                                                           1: ifne
                                                                             6
                                                           4: iconst 0
                                                           5: ireturn
                                                           6: iload 1
                                                           7: iconst 1
                                                           8: if icmpne
                                                                             13
                                                          11: iconst 1
                                                          12: ireturn
                                                          13: aload 0
                                                          14: iload 1
                                                          15: iconst 1
                                                          16: isub
                                                          17: invokevirtual #2
                                                          20: aload 0
                                                          21: iload 1
                                                          22: iconst 2
                                                          23: isub
                                                          24: invokevirtual #2
```

Interoperability with virtual machines

Markup languages

- Markup languages are a way of modeling data.
- XML and JSON can model data like objects.
- Markup languages are independent of programming languages.

```
<Person>
  <name> Cliff </name>
  <birthdate> 4/16/1978 </birthdate>
  <height> 74 </height>
  <weight> 212 </weight>
  </Person>

{
  "name": "Cliff",
  "birthdate": "4/16/1978",
  "height": "74",
  "weight": "212";
```

Interoperability with markup languages

- 1 Common difficulties in interop
- 2 Concepts in handling difficulties
- 3 Tools used in achieving interoperability
- 4 Conclusions

Conclusions
